TOYOTA

Comfort is a Toyota tradition. With the 8 Series, it starts from the time you enter. Grab the large assist grip, place your foot on the wide, low step and slide into the operator's seat that provides comfort, support and retention. Once you have been seated and wrapped your hands around the small-diameter steering wheel you will intuitively feel that everything you need for operating the forklift is within natural reach. You will also instantly realize that you have a clear view of the forks and load. This comfort sets the stage for reaching the true potential of the forklift from Toyota.

A large assist grip, A deep, wide step and a spacious opening team up for easy entry onto the forklift.

Comfort and Support ORS* Seat

The ORS seat can be adjusted 150 mm forward and backward to provide comfort and support to almost all sizes of operators. *ORS: Operator Restraint System

Wide Floor Space

Features and equipment may vary depending on market.

The spacious floor area enables a more relaxed operating position that contributes to comfort.

Outstanding Visibility

The overhead guard, mast and instrument panel have been designed to provide excellent visibility of the fork tips at the most frequently used lift heights.

ATOYOT

True Potential Through Outstanding Operability

Toyota used the latest technology to reexamine forklift operation in its search for enhanced operability. Motion-capture technology monitored every aspect of operator movement looking for ways to make operation more efficient. Based on these findings, well-thought-out design changes were combined to make the 8 Series ready to transform every action of the operator into smooth and efficient operation.

Operator-Friendly Steering Wheel

The small-diameter steering wheel teams up with the full hydraulic power steering system to provide excellent maneuverability. The steering column offers step-less adjustment to accommodate a wide range of operator preferences.

Foot-Activated Parking Brake

The operator simply depresses the parking brake pedal to set it without changing operating position. A conveniently located handle is used to release it.

Rear-Pillar Assist Grip OPT / Swivel Seat OPT

The seat swivels to the right to facilitate operation in reverse.

The seat also swivels to the left to make it easier to enter and exit

the forklift. An optionally available rear-pillar assist grip with a horn button enhances comfort by offering easy horn operation while traveling in reverse.

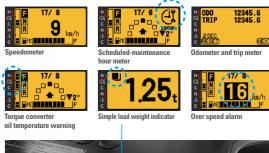

Multifunction Display || Diesel models: option Gasoline models: standard

The Multifunctional Display II offers useful information for operations. The following are some of the display screens.

Necessary instrumentation, such as the fuel meter, water temperature indicator and hour meter are shown in an easy-to-monitor digital format.

Mini Lever OPT

These small, easy-to-operate levers provide total load handling operation and travel direction selection. A fatigue-reducing armrest is provided.

Joystick OPT

Both lift and tilt operations are controlled by a single lever.
Simultaneous lifting and tilting can be operated.

Fork Vibration Damper OPT

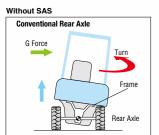

By installing two accumulators in the hydraulic circuit of lift cylinder fork vibration is absorbed over a wide range of load weight.

True Potential Through Outstanding Stability

At Toyota, safety is top priority in the quest for attaining true potential. Here, the state-of-the-art technology found in the System of Active Stability (SAS), which earned high praise on the 7 Series, helps to reduce the potential for accidents. Other innovative functions, such as the Operator Presence Sensing System (OPS) and optional Travel and Load Handling Control are ready to assist in protecting the operator and the load. Toyota's continuous efforts toward safety provide you with a solid foundation for outstanding stability.

Active Control Rear Stabilizer SAS

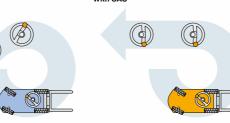

An onboard computer monitors the movement of the forklift and locks the swing of the rear axle when necessary, such as during turns.

Note: This function is not installed when the forklift is equipped with optional dual front tires.

Active Steering Synchronizer SAS

This function ensures that the angle of the steering wheel corresponds to the angle of the rear steered wheels.

Active Mast Function Controller SAS

Active Mast Front Tilt Angle Control

The angle of forward mast tilt is automatically controlled to match the lift height and load weight, helping to prevent load spills or tip-over.

System of Active Stability

Active Mast Tilt Speed Control

Helps to prevent load spills by automatically controlling mast tilt speed at high mast

Operator Presence Sensing System OPS

This lamp illuminates and a signal sounds to inform the operator that OPS is about to be activated. A warning function informs the operator when the direction selection lever has not been returned to neutral.

This system uses a switch sensor built into the operator's seat to detect the presence of the operator. If the operator is not in the proper operating position, travel power is interrupted and load handling operations are stopped. Note: OPS does not operate the brakes. Always set the parking brake before leaving the forklift.

1. Lift-Height and Load-Sensing Vehicle Speed Control

This feature limits the maximum speed if the operator attempts to travel while carrying loads at high lift heights, thereby reducing the likelihood of instability due to sudden deceleration.

2. Lift-Height and Load-Sensing Sudden Start Off Prevention Feature

This feature suppresses sudden acceleration of the vehicle to reduce the risk of load spills in the event that the operator suddenly depresses the accelerator or operates the direction selection switch while carrying loads at high lift heights.

3. Low-Speed Setting

This feature limits maximum speed to a preset level when the switch on the Multifunction Display is pressed. This can be useful at locations such as customer worksites that have different speed rules for outdoor and indoor operations.

4. Maximum Speed Limitation

This feature enables to limit maximum speed to a preset level. This helps operators maintain certain speed limits in the work area while freeing them from the need to control acceleration, and also reduces the need for forklift managers to monitor the speed of the forklifts.

5. Automatic Idle-Up Device

The idle revolution of the engine is automatically increased during lifting operations so that loads will be slowly lifted up without depressing the accelerator. It provides easy and proper load handling operation.

The following should be noted in regard to Travel and Load Handling Control. On up grade, the set speed may not be reached due to engine output. Also on down grade, gravity may cause preset speed to be exceeded. Although maximum speed and sudden acceleration are reduced in relation to load height and weight, this does not eliminate the possibility of tip-over. Toyota's advanced technology helps reduce the potential of forklift instability. However, the operator is ultimately responsible for safe operation.

Automatic Fork Leveling Control Pressing a switch during forward tilt automatically stops the forks at a level position. This makes load-handling operations easier, helping to achieve high productivity.

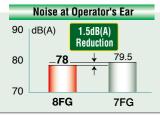

Travel and Load Handling Control OPT

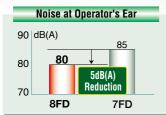

True Potential Through Outstanding Environmental Friendliness

The 8 Series is easy to get along with. It is specially designed to provide the operator and all those working nearby with a pleasant work environment. Low noise operation, low exhaust emissions and low vibration all mean that the 8 Series will hardly be noticed as it diligently enhances productivity at the workplace. And the 8 Series demonstrates that Toyota is continuing to make progress in eliminating harmful chemicals from the components of its forklifts, making them even more environmentally friendly.

Low-Noise Design

Meet your silent partner. Thick-sealing under the floorboards and the use of sound-absorbing and sound-proofing materials all work together to give the 8 Series low-noise operation.

3-Way Catalytic Converter System

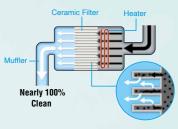

Electronic control is used on the 4Y engine to regulate the fuel injection and ignition systems. This is combined with the 3-Way Catalytic Converter System to filter out carbon monoxide (CO), hydrocarbon (HC) and nitrogen oxide (NOx) gases.

Diesel Particulate Filter DPF-II OPT

It uses an enhanced filtering system to provide excellent black smoke particle elimination. The DPF-II provides the additional benefits of easier starting and longer filter life.

Environmentally Friendly Design

The 8 Series is free of asbestos, mercury and cadmium. The amount of lead and hexavalent chromium has also been dramatically reduced in order to minimize the affect on the environment.

True Potential Through Outstanding Reliability & Serviceability

Reliability is what Toyota forklifts have proven themselves to provide under harsh conditions the world over. This is because Toyota is always committed to boosting reliability. The use of resin parts has been reduced as much as possible along with other steps to enhance durability. The result is a forklift that will offer an extended life.

Serviceability can help boost the reliability of a forklift and extend its service life. The 8 Series has been designed so that anyone can easily inspect it. If service is needed, easy access can help to reduce downtime.

The wide-opening engine hood provides easy access for inspections or servicing.

Radiator Cover

No tools are needed to remove the radiator cover. The fasteners can easily be turned by hand to enable quick inspections or servicing.

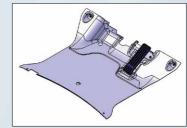

Brake Fluid

Simply lift up the cover on the panel to check the brake fluid.

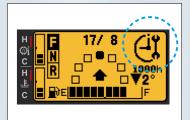

Hood Latch

The easy-to-operate latch provides quick access to the engine compartment.

Floorboard

A two-piece design makes the floorboard easier to lift and handle. Remove these two pieces for wide open access to the engine and power train.

Scheduled-Maintenance Hour **Warning Indicator**

When the set time for maintenance is reached, this feature provides visible and audible notification.

From the Chief Engineer "What are customers really looking for in a forklift?" In the development of the 8 Series, we took on the challenge of developing a forklift based on 50 cumulative years of technology with enthusiastic passion as our motivation. We returned to the starting point and took a careful look at the forklift itself from every aspect. The 8 Series stands ready to bring out the true potential in all owners and operators.

Hisao Nagata Chief Engineer of the 8 Series,

During the development of the 8 Series we combined our ongoing quality improvement activities with more than 4,500 customer surveys and this helped us to fully recognize what the current forklift customer needs were, and what those needs would be in the future.

The results lead us to conclude that the best method for satisfying customer needs was to: "investigate the essence of what makes a good forklift by basing our design on the 7 Series and by further infusing Toyota's strengths into

In continuing our evolution from the 7 Series we aimed for advances in the areas of safety, ergonomics, cost of ownership and environmental considerations.

In the field of safety we have added a traveling control option in addition to the existing

System of Active Stability (SAS) and Operator Presence Sensing (OPS) features. We have been able to realize this functionality by harmonizing the SAS technology with the optional electronic fuel injection (EFI) system that has been employed in the present design.

This field of ergonomics is inseparably linked to the concept of work efficiency. The ability of the operator to work in comfort is an extremely important factor in dealing with the high speed of the present-day logistics business. By paying close attention to all sizes, shapes and layouts of the operator compartment, we have been able to realize significant improvements in visibility and operator operating space. Through a concerted approach to reducing noise and vibration, we have created a forklift that has significantly reduced noise and vibration levels, as well as minimizing operator

Cost of ownership is closely connected with the issue of reliability.

As forklifts are a capital good, breakdowns that can stop customer productivity are a worst case scenario. By focusing on the areas of enhancing reliability, reducing downtime through making maintenance easier to perform, and extending maintenance periods, we have developed a forklifts series that is able

to make the greatest contribution to customer

Environmental factors are central to our thinking. Customers have also expressed a concern for the environment, a concern that we share. We have addressed this by using a multi-pronged approach. In the manufacturing process, we reduced and eliminated the use of materials that are environmentally sensitive. We have also developed a forklift with top-class emissions performance. This will reduce the output of undesirable substances over the lifetime of the truck, while simultaneously creating a cleaner work environment.

While this new design represents an evolution from the 7 Series, the development team began by re-evaluating the designs from scratch. They covered the smallest details – including each screw used in the forklift's construction to ensure the development of best-of-breed forklift units that truly satisfy customer needs. I believe we have created a series of forklifts that further enhance the reputation that Toyota has established over the years.

The development and design of the 8 Series was done at the Toyota Takahama Plant in Aichi, Japan. During the development stage, state-of-the-art technology was used to get a better understanding of operator movement during forklift operation. This data was carefully analyzed and used to enhance the design of the 8 Series. Then the 8 Series was exposed to test conditions far harsher than it will ever experience on the job. The result is a remarkable forklift series that will be providing productivity for years and years to come.
